

SIEMENS

Ingenuity for life

NX Mach Series add-on modules

Extending product development features and capabilities

Benefits

- Extend features and capabilities of the NX Mach Series
- Configure with process-, industry- and application-specific tools
- Provides flexible token-based licensing

Summary

NX Mach™ Series software offers preconfigured solutions targeted to specific product development disciplines and problems. You can extend and enhance the functionality of the Mach Series with add-on modules. These add-ons enable you to configure your solutions to specific requirements with specialized design tools, standard parts applications, design-integrated simulation solutions, programming and customization toolkits and direct translators. The “token licensing” marked add-ons in the product overview are part of the value-based licensing pool. Token licensing provides you with extra flexibility, as you can use the tokens to activate any product that is part of the token pool.

Core applications

NX provides various core functionalities that enable you to exchange data between proprietary systems and NX, check designs in full size with virtual reality tools and give you an extra boost in usability with artificial intelligence (AI) powered command prediction.

NX STEP AP 242*

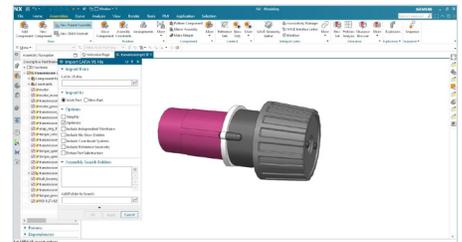

Bidirectional translation using the STEP AP242 translation protocol

NX CATIA V4 translator*

Delivers bidirectional translation between CATIA V4 and NX. Users can access files from the file open, file save as, file import and file export dialogs. This tool flattens assemblies to a single level on both import and export.

NX CATIA V5 translator*

Provides bidirectional translation and reads CATPart and CATProduct files. This tool reads coordinate systems, points and part substructure, geometry, assembly structure and attributes of color, layer and name into NX.

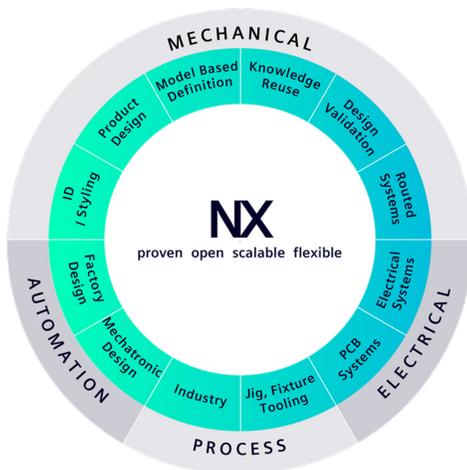

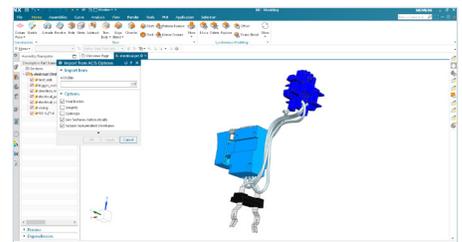

NX Pro/E Interface*

Reads native Pro/E and Creo solids and surfaces from *.prt and *.asm files and creates an NX part or assembly.

NX ACIS Translator*

Two-way data exchange between NX and CAD models in the ACIS modeling kernel format.

*Token licensing available

[siemens.com/nx](https://www.siemens.com/nx)

NX Mach Series add-on modules

NX Translator for IFC

Bidirectional translation using the Industry Foundation Classes (IFC) file format, which describes architectural, building and construction data.

NX Command Prediction*

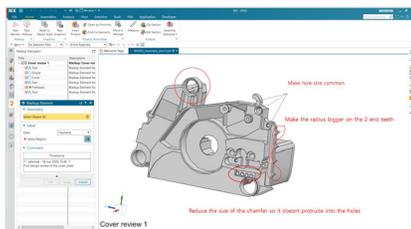

The machine learning/artificial intelligence-enabled user interface can predict and serve up commands to the user based on learned command usage patterns. It allows design environment personalization by considering the differences in knowledge, style and preferences. Leveraging and sharing of learned command usage data enable a reduced learning curve, promote use of domain and or industry-specific best practices and increase productivity.

NX Viewer*

With NX Viewer, NX models and drawings can be opened, viewed and measured in the native NX format. This is ideal for users who have access and need to view NX data, but do not intend to save or reauthor NX data.

NX DMU and Markup*

Provides access to digital mockup (DMU) and markup functions including create DMU workset, create snapshot, manipulate snapshot, insert product, move in work set, reset to design state and add markups.

NX DMU & Markup Add-on for NX Viewer*

Provides the NX Viewer user with the ability to perform digital mockup functions.

NX Virtual Reality Review

With NX Virtual Reality, designers and engineers can experience designs at human scale giving a unique perspective. NX Virtual Reality is fully integrated enabling one-click access to an immersive experience with no data preparation. All the inspection tools in NX Virtual Reality will be familiar to NX users including measure, section, hide and isolate.

NX Virtual Reality Collaborate

Now with the addition of multi-person collaboration, entire teams can collaborate in NX Virtual Reality to review designs at the same time, from anywhere in the world.

NX Appearance Management*

Enables designers and engineers to quickly and easily set up a series of visual appearances on a single master model.

When combined with NX Render, these visual appearances can be rendered at high quality for design reviews or marketing assets.

NX Multi-user Design Notification*

This functionality allows designers to save time and eliminate rework by discovering design changes as they occur. Designers can decide which parts they follow and get notified when the followed parts are checked-out, checked-in or saved. Loaded parts are automatically updated to the latest version and users can customize the notification center.

Mechanical

Industrial design and styling

Create aesthetically appealing, innovative products with fast concept design, freeform shape modeling and surfacing capabilities including subdivision modeling, class-A surfacing and reverse engineering. Enhanced visualization with both dynamic and real-time photorealistic rendering tools create visually stunning models.

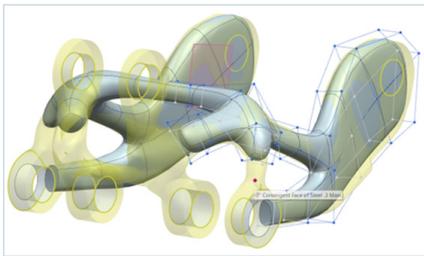

NX Render*

Powered by best-in-class rendering technology, NX Render enables the creation of photorealistic images for design reviews, marketing assets and sales collateral. Creating the perfect looking image in NX Render is now easier than ever with the addition of an all-new set of render-ready materials. In minutes you can drag-and-drop materials, lighting and cameras into your scene to achieve amazing results.

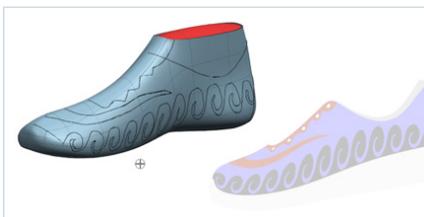

NX Realize Shape*

Using subdivision modeling methods, users can create advanced 3D product shapes with unprecedented speed and ease of use. The toolset is equally suited to creating quick 3D concepts or final surface shapes of the highest quality. NX Realize Shape™ is fully integrated with all other NX modeling functions, allowing for seamless incorporation with traditional modeling approaches to achieve a high degree of refinement of the design.

NX Draw Shape*

Enables designers to visually convey and communicate aspects of the design prior to investing in 3D models. This add-on enhances NX capabilities by enabling freehand drawing of wireframe shapes on bodies.

Product design

The core modeling capability of NX combines wireframe, surface, solid, parametric and direct modeling in a single environment that enables designers to choose the most appropriate tool for the task at hand. Pioneering capabilities such as synchronous technology and Convergent Modeling™ technology make it easy to edit designs with simple push-pull methods and work with facet/mesh data in the same modeling environment. The adaptive UI of NX uses machine learning to help designers improve productivity.

NX Show/Hide Similar

This machine learning-enabled functionality allows user to show or hide multiple components that are geometrically similar to a selected component. This functionality helps you to easily declutter assemblies or perform operations on geometrically similar components.

Layout for NX

This 2D conceptual design solution allows you to take advantage of essential 2D requirements and to leverage a familiar drawing environment. NX Layout provides many dedicated tools to support 2D data migration, 2D design and layout as well as 2D-to-3D capabilities to explore concepts in 2D, iterate and transfer to 3D to generate 3D models and assemblies.

NX WAVE Control*

NX WAVE Control is a geometry linking tool that enables designers to define interpart relationships for parametric assembly modeling. WAVE assembly control structures and constraints help simplify design changes and accelerate modeling of configurations, options and variants.

NX Assembly Path Planning*

The assembly path planning software automatically determines the optimum, interference-free path for extracting a component from an assembly. The resulting path is stored as a set of steps within an assembly sequence. The extraction path can streamline serviceability studies by verifying component access without requiring a physical prototype or extensive analysis. **NX Lattice Structures**

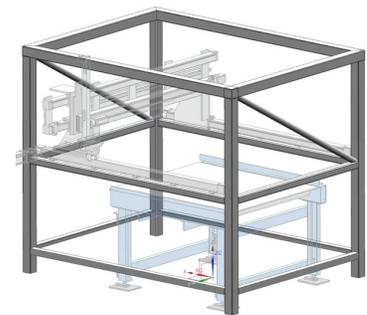

Design

Often used in additive manufacturing, lattice structures allow weight reduction without compromising structural integrity. NX Lattice Structures Design provides a powerful set of design capabilities including custom lattice cells to suit specific design needs such as improved strength, rigidity, impact resistance, energy absorption or porosity, as well as custom and randomized lattice structures. Filtering for individual lattice rods and creation of special tetrahedron surface and volume lattice structures is possible.

NX Structure Designer*

Create structural frames more efficiently with the easy-to-use structural frame modeling capability. You can create structural frames in minutes by leveraging the frame drawing assistant, which can create 2D skeletons with minimal clicks.

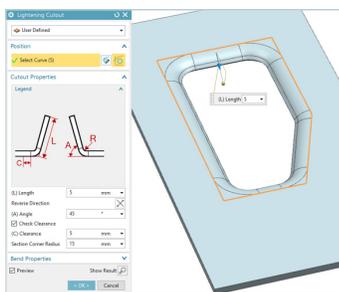

NX Topology Optimization for Designers

This design optimization tool can be used to automate the improvement of structural designs, while still meeting the

various performance, material and manufacturing requirements. It contains powerful optimization capabilities including the ability to set up and perform an optimization on a single component or system assembly, the ability to add various design and manufacturing constraints to control the results of the optimization, such as design symmetry, offset, shelling, blending, additive overhang angles, additive self-supporting, additive material spreading, molding, casting, machining and extrusion.

NX Advanced Sheet Metal*

Users can model complex sheet metal parts that contain drawn features and nonlinear bend lines. The advanced flange function allows easy creation of nonlinear flanges using customer input parameters or existing geometry to define shapes and specify end limits. The completely revised joggle function enables complex joggles to be added to flanges or tabs including single and multiple jogs. The flat pattern feature provides rich data for downstream consumption.

NX Fabric Flattener*

Designed to generate flat patterns for woven or unidirectional fabric materials. It can be used to flatten composite laminate plies, or any materials that conform to the theoretical models for woven or unidirectional fabrics.

NX Human Modeling*

Designers can create feature models of human beings, which can be used identify fit, clearance and reach issues in designs. The human models can then be used to explore and verify how people interact with product designs, all within the NX environment.

NX Human Modeling Posture Prediction*

Specifically aimed at the automotive industry, posture prediction enables users to position a model of a human driver, front passenger, or rear passenger in a statistically accurate seated position inside an automotive vehicle. Users specify the position of the hands and feet in a specific location, such as the driver's hands and feet touching the steering wheel and brake pedal and the model then predicts an occupant's hip location, eye locations and arm and leg positions based on the type of vehicle and the occupant's hand and foot locations.

NX Weld Assistant*

Creates weld, structural adhesive and mechanical connection features. It includes resistance spot welds, mechanical clinches, arc welds in the shape of fillets, butt, J, V, bevel and flared bevel. Sealer beads can be generated with any cross-sectional shape and spray-on adhesive, mastic or glue can be defined. There are validation checks for all discrete weld types along with import and export capability. An automatic annotation function generates standard weld symbols and product and manufacturing information (PMI), and all weld features can be published to Teamcenter when running in managed mode.

NX Drawing Automation*

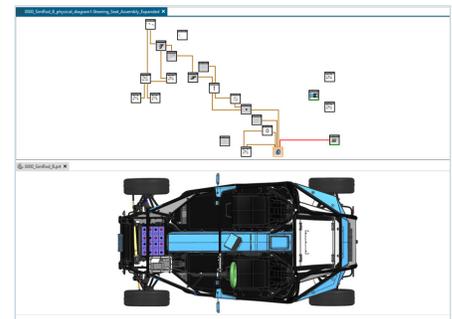

Provides a framework for developing a company-specific drawing automation solution. With this framework, users can define a highly customized set of rules for creating drawings to specification. Also included are tools for developing custom templates used to automate the drawing process.

NX Physical Architecture Diagram Author*

Used for model-based systems engineering (MBSE), this add-on helps with managing and tracing large numbers of product and technical requirements throughout the design process. It can show connections such as WAVE links, assembly constraints and dimensions between components of a 3D assembly and reports on the status of requirement checks on measurement. The package can be used standalone in NX or in conjunction with Teamcenter MBSE parameter management.

NX Physical Architecture Diagram Viewer*

The viewer shows connections such as WAVE links, assembly constraints and dimensions between components of a 3D assembly and reports on the status of requirement checks on measurement.

NX Physical Parameter Management Author*

Also used for MBSE, this add-on manages mechanical requirements and measures results for master 3D and CAE models. It enables users to create and report on measurements in the CAD model and also reports status of checks on values from CAE results performed in other applications such as Simcenter™ 3D software.

NX Physical Parameter Management Viewer*

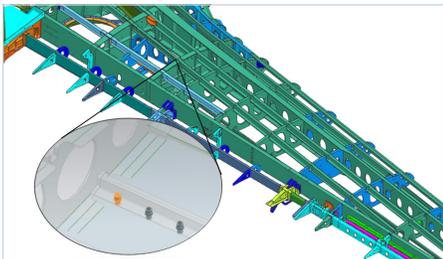

The viewer displays reports on measurements in the CAD model and also reports status of checks on values from CAE results performed in other applications such as Simcenter 3D.

NX Reference Point Cloud View

NX Reference Point Cloud View allows users to visualize point cloud files in the point database (POD) format. The software enables designers to easily add referenced point cloud objects into layout models (for example from NX Line Designer and ship design applications) and perform various operations on the point clouds including measurements and clipping. NX Reference Point Cloud View helps improve virtual planning workflows and reduces the number of errors during the physical implementation.

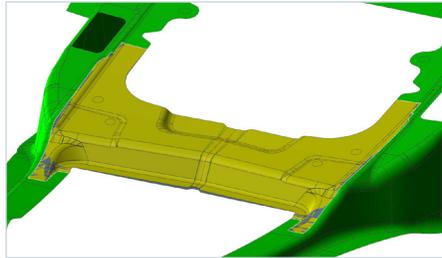

NX Join*

Reduces the time to place and define fasteners and hardware, while improving the quality of the fastener assembly design. Users can define standard join features with information and attributes about the connection between assembly components. NX Join covers the basic definition of point-based connections including rivets, bolts, adhesives, and spot welds.

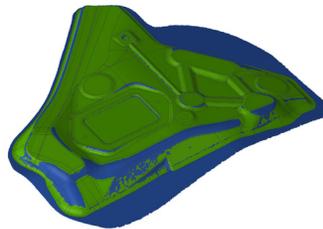

NX OmniFree Transformer

Morph surfaces to points or curves in the NX environment. The points/curves compensate for springback that occurs during stamping.

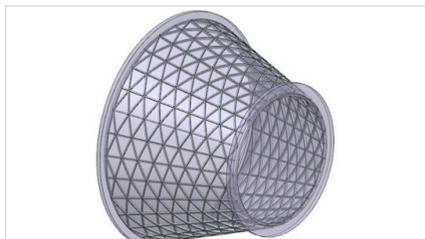

NX OmniMesh Transformer

This add-on is used for tool morphing, providing capabilities to morph surfaces to CAE meshes, STL data or point clouds in the NX environment. The mesh/STL/point cloud compensates for springback that occurs during stamping.

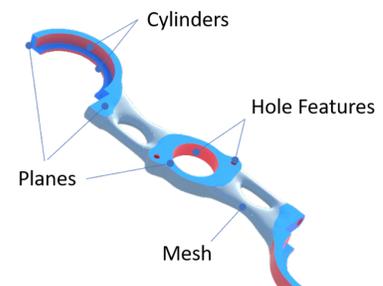

NX Algorithmic Modeling* This module aids in the creation of algorithmically driven designs. Users can design and automate advanced variational, parametric shapes that are not possible through traditional interactive CAD modeling. It uses a novel, logic editor-based approach to building an algorithm that defines the shape and variability of a design provides an easy-to-use interface and works ideally for automation and design templization.

NX Advanced Convergent Modeling™

Innovative capabilities to seamlessly work with mesh geometry in an integrated CAD workflow. With the aid of this add-on it becomes much easier to work with data from 3D scanners, polygon modelers and simulation software and data from topology optimization. These tools also make it easier to prepare mesh (STL) geometry for 3D printing.

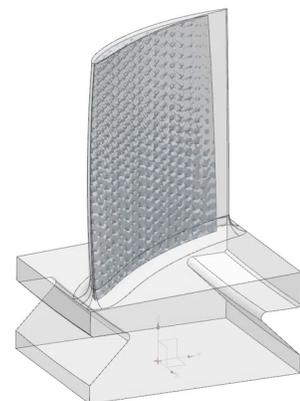

NX Implicit Modeling*

Users can create equation-driven structures and perform robust modeling operations on complex designs. Advanced geometric shapes can be designed with relative ease and complex operations between geometry have a high degree of robustness over more traditional methods like b-rep modeling. Through the usage of Convergent Modeling, NX can represent these results in a usable format for downstream modeling and simulation/manufacturing operations.

NX Design for Additive Manufacturing*

Innovative capabilities that aid in the process of designing parts that are suitable for production using 3D printing.

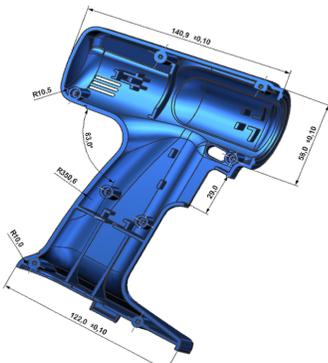

Model-based definition

Model-based definition capabilities in NX enable the production of a complete digital definition of a product within a 3D model. By establishing the model as the single source of truth, NX reduces the time spent on engineering documentation, drives downstream tools for validation and manufacturing, and reduces late changes and scrap.

NX Model-based Definition

NX Model-based Definition is an add-on to the NX Product and Manufacturing Information application and delivers advanced capabilities to support model-based definition deployments.

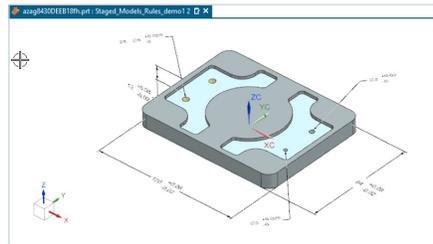

NX PMI Effectivity*

NX PMI Effectivity helps users who design products that contain a large number of variations determine which product and manufacturing information (PMI) on a model is relevant for each product configuration. NX PMI Effectivity adds the ability to infer the effectivity of PMI objects based on the geometry referenced by the PMI. This will enable the display of only those PMI objects that are relevant to the selected configuration of the product.

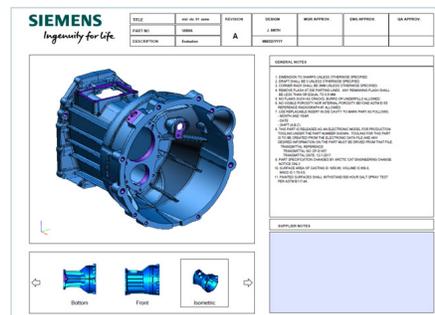

NX Staged Models*

Streamline the overall staged model design process for production planning and author complete manufacturing information within the 3D staged models. It includes geometrical representation of staged models, PMI and other manufacturing process information.

NX Technical Data Package

A technical data package can contain important technical data such as models, drawings, associated lists, specifications,

standards, and performance requirements. NX Technical Data Package provides functionality to create, modify, save, store and re-use technical data package templates and to publish technical data packages to industry-recognized formats, JT plus PDF and 3D PDF.

Knowledge re-use

The knowledge re-use capabilities in NX shorten design cycles, reduce development costs, and improve productivity. With knowledge-driven automation capabilities, your company can capture, re-use, and consistently apply best practices across product lines.

NX Product Template Studio Author

Templates can be used to modularize a design, breaking a complex assembly into manageable modules that can then be recombined as needed to configure complex products. NX Product Template Studio Author can add a user-defined interface to any parametric model, which allows parametric models to be intuitively described and packaged for later re-use.

NX Product Template Studio Consumer*

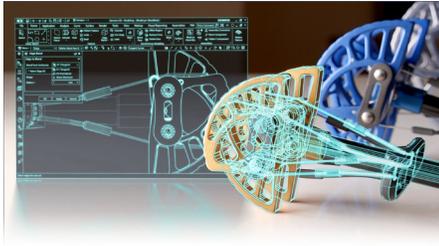

Display and interact with user-defined template interfaces created by the Product Template Studio Author application. This consumer license will also enable the template model user interface to be automatically invoked as template models are consumed from the NX Reuse Library.

NX Open Toolkits Author

NX Open is a collection of application programming interfaces (APIs) that enable custom applications for NX through an open architecture using well-known programming languages (C/C++, Visual Basic, C#, Java, and Python). Custom programs can automate complex and repetitive tasks, integrate third-party applications and customize the NX user interface.

NX Open for .NET Author

The NX Open for .NET Author license provides the NX .NET API libraries, documentation, and utility tools required to create .NET custom applications.

NX Open Python Author

The NX Open Python Author license provides the NX Python API libraries, documentation, and utility tools required to create Python custom applications.

NX Open Dialog Designers

NX Open Dialog Designers provide the application modules, visual dialog builder, libraries and documentation necessary to interactively construct production-quality dialogs for use in the NX environment and supported platforms. The dialog designer consists of two design tools: the Block Styler, which provides interactive tools to design block-based dialogs, and the User Interface Styler, which provides various widgets to construct a dialog for use in the NX environment.

NX Open GRIP Author

Graphics Interactive Programming (GRIP) is a programming language that enables automated operations in NX. In some cases, GRIP can perform advanced, customized operations in a more efficient manner than using NX interactively. NX Open GRIP Author provides the GRIP Advanced Development Environment (GRADE) for editing, compiling and linking GRIP programs.

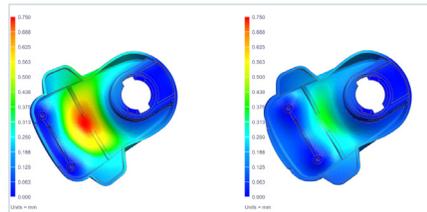

Design validation

NX provides powerful visual product analytics and validation tools that enable you to quickly synthesize information, check designs for compliance to requirements, and make informed decisions. Integrated design-for-manufacturing checks significantly reduce engineering change orders (ECOs), manufacturing defects, costs and

delays. With design-integrated motion, structural, and thermal simulation tools in NX, you can quickly compare design alternatives and optimize performance characteristics from the earliest stages of the design process.

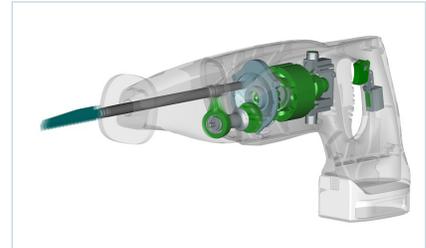

NX Design Simulation

This design-integrated structural simulation tool helps you validate the structural performance of your design. Compare design alternatives and optimize performance characteristics of products from the earliest stages of the design process. Simulation technology is based on and scalable to Simcenter 3D for further analysis by expert analysts. The result is a highly iterative and predictive engineering process that delivers innovative designs, higher quality products and reduced time-to-market.

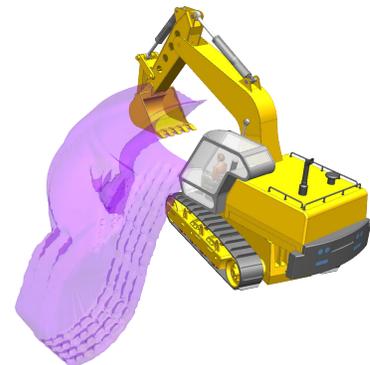

NX Motion

Predict and understand the functional dynamic mechanical behavior of assemblies and mechanisms. NX Motion is an advanced yet simple-to-use solution that allows designers and engineers to understand, evaluate and optimize the complex motion behavior of assemblies and products. Based on Simcenter 3D simulation technology, NX Motion is a complete solution for kinematics and dynamic motion analysis of rigid multi-body as well as static equilibrium, and data can easily be transferred to Simcenter 3D for more detailed analyses. The early use of performance simulation is key to the evaluation of design options to increase design confidence and reduce risk.

NX Animation Designer*

With this easy-to-use motion simulation application, designers can model the kinematic behavior of any product with moving parts in a time-based manner. This application helps designers gain a better understanding how the product will operate and determine clearances between parts during movement. NX Animation Designer can also be used to create disassembly animations for visually appealing product presentations.

Simcenter FLOEFD for NX

A full-featured 3D computational fluid dynamics (CFD) analysis solution, Simcenter™ FLOEFD™ software enables design engineers to work directly on their CAD models to prepare and evaluate CFD simulations for fluid flow and heat transfer.

NX EasyFill Analysis

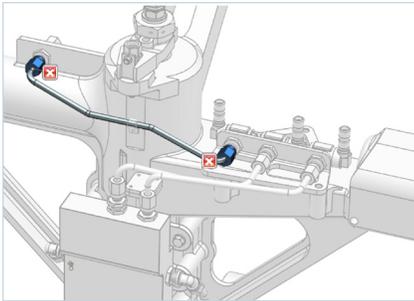

This integrated mold flow simulation tool enables designers to analyze part and mold designs during early stages of design. The analyses can be done with a pioneering 3D technology and through high-performance 3D filling simulation.

NX EasyFill Analysis – Advanced

Validates mold designs prior to manufacturing through capabilities such as multi-gate analysis, packing, shrinkage and fiber orientation. In addition to these capabilities, simulation preprocessing and postprocessing are performed inside the NX CAD environment.

NX Check-Mate Author

NX Check-Mate provides an automated, customizable tool that helps users proactively improve product quality. The customization capabilities deliver reliable model and part checking and make sure that your CAD data meets your expectations.

NX DFMPPro

This validation add-on executes design-for-manufacturability (DFM) checks on your CAD model by using a one-button click to identify potential problem areas. This check returns valuable information about model integrity with respect to downstream manufacturing processes. The checks include coverage of injection molding, casting, sheet metal, tubing, general machining and assembly.

NX VDA 4955 Checker*

The Association of German Automobile Industry (VDA) add-on software checks the quality of curves, faces, solids and drawing data in an NX part file. It verifies that curves and surfaces adhere to international standards and local country regulations.

NX HD3D Visual Reporting*

NX HD3D Visual Reporting software displays information of interest from your company's data sources directly into the

3D product design environment. The capability helps designers make unambiguous assessments, interpret information more accurately and synthesize product and process data rapidly into correct design decisions. NX HD3D Visual Reporting comes with a set of predefined, out-of-the-box reports that provide design teams with answers to commonly asked questions. Reports related to ownership, check out, part maturity, projects, load status, validation status and more are available for instant use. With the authoring capability, companies can create and modify custom reports to extract and present the data.

NX One-step Formability Analysis*

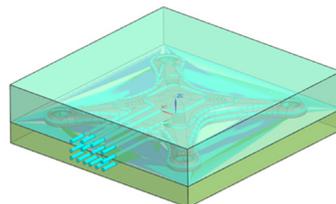

NX One-step Formability Analysis provides a quick and accurate finite element modeling (FEM) sheet metal forming analysis, while also providing tools for creating flattened blanks and pre-forms from complex freeform geometry.

NX Molded Part Validation*

Analyzes parts and automatically provides designers with information about draft angles, undercut areas, sharp corners, small radiuses and other items that could compromise molding quality. It also provides designers with an easy visual check of core and cavity sides.

NX Mold Cooling*

NX Mold Cooling provides wizard-based capabilities to rapidly simulate the thermal performance of injection mold inserts,

identify hot spots and uneven temperatures on the parts, generate reports and compare the performance between design iterations. Users will be able to perform both 1D duct flow simulation and 3D CFD simulation.

NX Forming

The advanced forming analysis solution offers state-of-the-art capabilities for sheet metal forming analysis and all steps in the forming process, including gravity, binder wrap, crash forming, drawing, trimming, flanging and springback.

NX Forming SMP

By enabling parallel processing, users can solve larger forming analyses very quickly. Using distributed memory architecture, NX Forming SMP offers high performance computing (HPC) by taking full advantage of multiple-CPU, multiple-core and multiple-thread configurations of the latest computing platforms in the Windows environment.

Routed systems

NX digital product development solutions include an integrated suite of tools that facilitate the entire design process for routed systems, including wire harnesses, cables, piping, tubing, conduit and raceways. These process-specific tools reduce detailed design time, improve product quality and transfer product information seamlessly between the logical design, physical design, analysis, manufacturing and service domains.

NX Routing Base*

NX Routing Base provides core capabilities used by all NX routed system design solutions. These includes all of the general capabilities needed to create, edit, copy and move paths. NX Routing Base also includes tools for defining standard part libraries, selecting parts from libraries and intelligently placing standard parts within the paths. It also enables designers to define standard stock specifications and assign them to paths.

NX Routing Piping and Tubing*

Optimizes piping and tubing design workflows through intelligent path creation, specification-driven part selection, smart part placement, collision detection, weight calculations and knowledge rules that concurrently validate designs against company and industry standards. The product supports both rigid and flexible pipes and tubes.

NX Routing HVAC*

NX Routing HVAC delivers 3D tools for creating, modifying, validating and documenting HVAC systems. It optimizes HVAC design workflows through intelligent path creation, specification-driven part selection, smart part placement, collision detection, weight calculations, duct splits, duct size calculation and knowledge rules that concurrently validate designs against company and industry standards. The product supports predefined catalogs of HVAC parts and parametric templates that can be modified on-the-fly (smart sizing) to fit any space constraints. Together with other NX capabilities like hangers and sheet metal flat patterns, this product provides a complete lifecycle solution for HVAC design.

NX Piping Fabrication Drawings and PMI

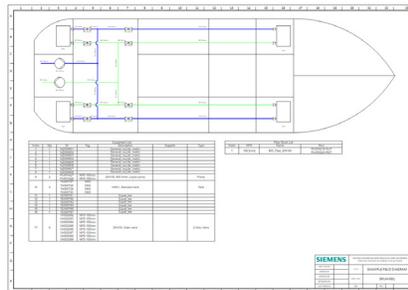

An add-on to NX routing that creates 3D PMI information and corresponding piping isometric drawings from piping models. All the necessary information for downstream fabrication is captured in the form of dimensions and annotations from the 3D model. Custom parts lists can also be created for the fabrication drawings. Existing PMI views with dimensions, annotations and tables can be updated based on changes to the 3D model.

NX Penetration Management*

NX Penetration Management provides an interface for creating, managing and responding to penetration requests between different user groups responsible for steel structures and routed system design. The process begins with a routed system designer (such as a piping designer) who requests pipe penetrations through structures that are designed and maintained by a different design group such as a structure group. A penetration request defines the location of the required cutout and initiates a workflow that can be customized by the end user to meet specific needs. A typical workflow includes several review steps that must be completed before the cutout can be created to satisfy and close the request.

NX P&ID Designer

Designers can create piping and instrumentation diagrams with this 2D authoring tool. The application includes authoring capabilities, libraries, connectivity validation, 2D-to-3D integration and object-level data management using Teamcenter. Companies adopting NX P&ID Designer can expect to realize a faster, more flexible design and change process for reduced design costs and faster times to market.

Electrical

Electrical systems

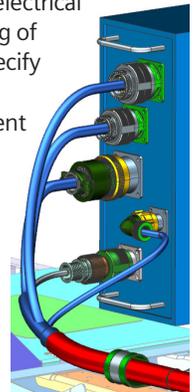

NX offers advanced software tools for the complete development of electrical systems, from electrical/electronic architecture definition, through detailed electrical design and wire harness manufacturing, to documentation and diagnostics.

NX Routing Cabling*

Helps with routing electrical cables in a product assembly along with typical mechanical parts and supporting equipment such as conduit and raceways. The software can automatically find paths that have been routed between devices and can assign the cable descriptions to the path segments. Actual cable lengths and diameters can be automatically added to the connection list for feedback to upstream ECAD applications or downstream to manufacturing applications.

NX Routing Harness*

Designers can route an electrical wiring harness consisting of bundles of wires and specify typical mechanical parts and supporting equipment such as connectors and other devices. The software can also import the wiring characteristics for connections between electrical devices. Actual wire lengths and diameters can be automatically added to the connection list for feedback to upstream ECAD applications or downstream to manufacturing applications.

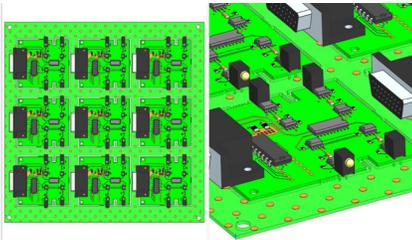

PCB systems

NX provides an environment for the design of both flexible and rigid printed circuit boards (PCBs). Based on workflows common to the design of printed circuit boards, the PCB design tools help model printed circuits rapidly and accurately in the context of an assembly and send the outlines to manufacture or to an ECAD system for further refinement.

NX PCB Exchange

NX PCB Exchange provides a foundation for intuitive and efficient design of rigid and flexible printed circuits. NX PCB Exchange allows direct connection with

all major printed circuit board (PCB) design applications, supporting various PCB data interchange formats (IDF, ProSTEP EDMD Schema, IDX) and manufacturing formats (ODB++, GenCAD).

NX PCB Exchange for Zuken

Transmits information between NX and Zuken CR-5000 and CR-8000 PCB design software. Data such as the board outline, hole placements, component placements, keep-in and keep-out regions can be transmitted back and forth using a format native to the Zuken product. The software also enables enhanced data exchange concerning board layers, copper trace geometry and bend region geometry.

NX Flexible PCD*

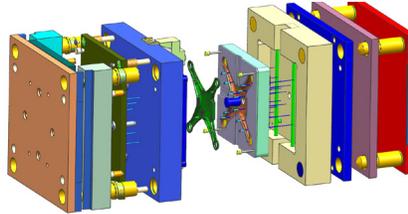

The PCD design tools help model printed circuits rapidly and accurately in the context of an assembly and send the outlines to manufacturing or to an ECAD system for further refinement. The printed circuit model developed in NX can be checked for clearances and tolerances, and the finished board model can be transferred to an ECAD system for component placement and circuit trace or layer development.

Process-based applications

Jigs, fixtures and tooling

Automate the entire tool development process including part design, tool assembly layout, and detailed tooling design and validation using advanced NX functionality. With step-by-step guidance and associativity to part designs, you can work with even the most challenging tooling and fixture designs.

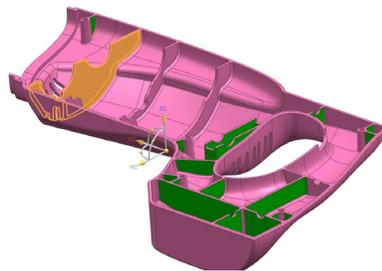

NX Mold Wizard*

Designs can be created quickly and efficiently with this complete working environment of supporting functions and component data for mold designs. A process thread approach is employed to identify and develop the critical functions required to complete mold design tasks. The approach includes the implementation of tools that simplify, automate and guide users through the tasks involved in the design of plastic injection molds.

NX Feature2Cost – Stamping

The NX Feature2Cost add-on provides the capabilities needed to analyze the

product design and identify key features such as bends, embossing and sheet metal thickness that influence the manufacturing of stamping tools. Once the features are analyzed and identified, the information is transferred to Teamcenter tool costing software to estimate manufacturing costs.

NX Feature2Cost – Mold*

Helps users to analyze the product design and identify key features such as ribs, openings, cores/cavities, side cores and others that influence the manufacturing of injection molds. Once the features are analyzed, the information about these features is transferred to Teamcenter tool costing to estimate the cost to manufacture the injection molding tools.

NX Flow Blend

Enables designers to create robust constant or variable blends along multiple complex faces with small curvatures that are essential for manufacturing.

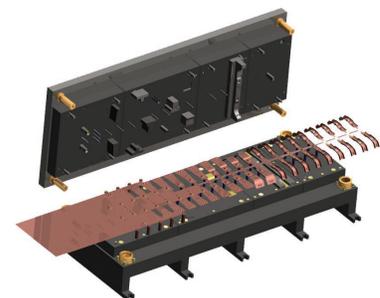

NX Electrode Design*

A time-saving, step-by-step solution that streamlines design and production of electrodes for electrical discharge machining (EDM). This solution helps automate and effectively design, validate, document, manufacture and manage the entire electrode development process from design through production.

NX Progressive Die Wizard*

The NX Progressive Die Wizard add-on offers the tools to construct progressive stamping dies. When planning the forming process, designers can define the pre-process, unfold the part and perform formability analysis (using NX One-step Formability Analysis), nest the flat pattern (blank layout), design the scrap, and determine the strip and tool layout.

NX Die Structure Design*

Assists tool designers with specific tools for creating blank, draw, trim and flange dies and associated transfer equipment for stamping sheet metal parts.

NX Die Engineering*

The Wizard-like environment provides process-specific tools for die face design.

NX Molded Part Validation*

Analyzes parts and automatically provides designers with information about draft angles, undercut areas, sharp corners, small radiuses and other items that could compromise molding quality. It also provides designers with an easy visual check of core and cavity sides.

Industry-specific applications

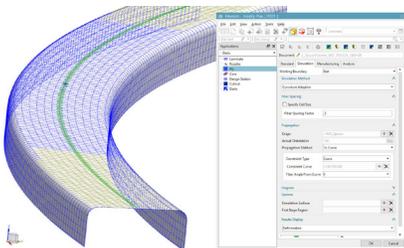

NX delivers workflow solutions built for the specific needs of individual industries with modules for aero structure design, vehicle design automation, ship structure design, human modeling and automation engineering of production systems.

NX General Packaging*

NX General Packaging is a set of software assistants and advisors that automate a wide range of tasks associated with the mechanical, safety, vision and occupant packaging of a vehicle. The vehicle design automation functionality checks designs for compliance with international standards and local country regulations.

Fibersim*

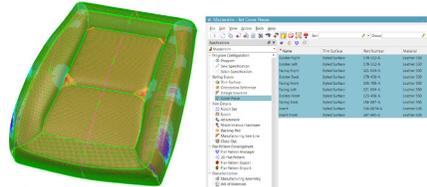

The Fibersim™ portfolio includes special-purpose tools for engineering and manufacturing parts from fiber-reinforced

composite materials. The software delivers a 3D environment that supports a concurrent engineering process in which design and analysis are performed in the context of the manufacturing process.

Mastertrim

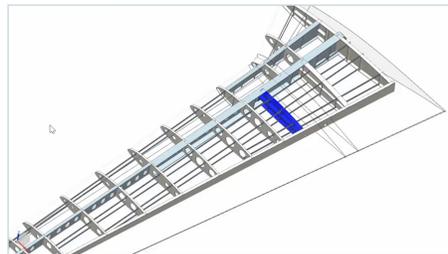

Mastertrim™ software provides tools for engineering transportation seating and

interiors that efficiently define, communicate and maintain a complete and single representation of the automotive seat and interior components across disciplines. Once the master model is defined, Mastertrim provides upstream and downstream benefits, including enabling concurrent engineering, early cost feedback, quicker and more reliable changes, styling criteria verification and the reduction of design iterations.

NX Aerospace Design*

NX Aerospace Design offers a set of tools (aero step, aero rib, aero shelf, aero flange) specifically tailored for designing aerospace parts. NX Advanced Sheet Metal tools for the creation of non-straight-brake parts are also included.

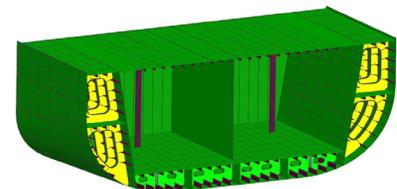

NX Ship Structure Basic Design*

Designers can quickly model a preliminary macro view of the ship based on inputs available from the concept design stage. Users can easily model and modify a structural macro view of the ship to support early design-stage analysis, drawing generation and transition to detail design. The basic design model includes hull, plate and profile systems that can be further split with seams into smaller subsystems. Designers can define

decks, bulkheads, pillars, stiffeners and edge reinforcements. Standard parts, brackets and cutouts can be added to the basic design model. The resulting models can be used in gross material estimates and weight and center-of-gravity calculations. The basic model transitions seamlessly to detail design.

NX Ship Structure Detail Design*

NX Ship Structure Detail Design provides tools needed to define and modify ship structural detail parts. It includes parametric detail feature definition for quick placement and modification of plates, stiffeners, brackets, holes, profile cutouts, clips and collars, chamfers, end cuts, corner features, edge features and flanged plates. It also supports creation of structural pillars and application of insulation material to steel surfaces. All data generated from detail design can be used for manufacturing and production planning outputs.

NX Ship Structure Manufacturing Preparation*

NX Ship Structure Manufacturing Preparation enables creation of data for structural part fabrication. Manufacturing parts can be created from the detail design parts within a manufacturable unit and can be restructured to organize parts and enable welds distribution within the manufacturing assembly structure.

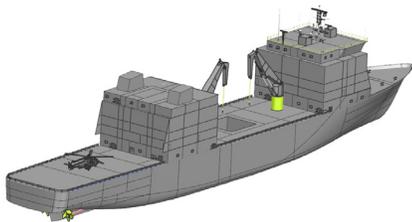

NX Ship Drafting*

Aids in the creation of ship drawings required for classification approvals. Users can create frame bars on drawing views along with shipbuilding-specific baseline dimensioning methods. Ship section drawing views can be automatically annotated to include stiffener section symbols, structure ID symbols, filling lines representations, scantling information and continuity symbols. Designers can add annotations to each ship structure object and control color, fonts and widths of the ship structure lines.

NX Ship General Arrangement Design*

Ship designers can create quick and accurate proposals for new ships based on customer requirements during the concept design phase. It provides tools for creating a 3D model of the general arrangement of a ship and its corresponding 2D drawings. The application

includes the capability to initialize the general arrangement design process based on a configurable product structure along with the definition of the concept grid model and the deck-based breakdown of the ship. Each deck can

then be detailed by individual designers into room spaces based on a specific purpose. Net and gross volume and surface area for each space is calculated. The ability to add standard equipment, parts and accommodation-related items from the re-use library to these spaces is also provided.

NX Issue Management

Adds an interface inside NX for integrating directly with Teamcenter-based issue management capabilities. The tool enables NX users to directly create, edit, and manage issues and associate 2D images and other files with issues.

NX Rules-based Structure Welding*

Enables shipbuilders to automatically define welds in the 3D model. This application generates a lightweight object to represent each weld joint, enabling very large quantities of welds to be defined and worked with in NX. The software creates weld joints automatically based on the 3D part geometry and material, including the placement and bevel configuration. Supports varying bevels, 3D edge preparations, automated product manufacturing information and drawing weld symbols.

Automation

Mechatronic design

NX provides a multidisciplinary approach to machine design that breaks down barriers between electrical, mechanical and automation engineers. With a library of joints, motors, sensors and actuators

along with kinematic and dynamic properties for each component, machine designers can rapidly perform a physics-based, interactive simulation to verify machine operation.

NX Mechatronics Concept Designer*

NX Mechatronics Concept Designer (MCD) delivers a functional design approach to build concept models that combine mechanical, electrical and software components based on system-level product requirements. It enables early conceptual design in the disciplines of mechanical, electrical, and automation design and engineering and their associated parallel interdisciplinary workflows, supporting a coarse-to-fine product development process.

NX MCD Player*

A read-only viewer and simulation player for models created with MCD software. The player enables users to load and play simulations of mechatronic machines. Additional signal mapping capabilities are available to drive simulations using programmable logic controller (PLC) hardware or virtual software simulations of a PLC.

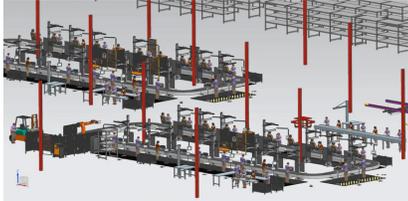

Factory design

With NX you can quickly design and visualize layouts of production lines and associate them to manufacturing planning. You can easily optimize the process by specifying each production step down to managing a single manufacturing resource, such as a robot or fixture. Perform accurate impact analysis and drive efficient change management by using a library of parametric resources.

NX Line Designer

The powerful manufacturing layout solution is integrated with Teamcenter fourth-generation design (4GD) or manufacturing process planning. It delivers a rich library of parametric equipment

including racks, conveyors, safety equipment and material handling equipment that can be used with Teamcenter Classification.

NX Automation Designer

With this solution for electrical and automation engineering of factory lines and machines, designers can re-use model geometry of NX designs to structure devices, configure controls hardware and validate engineering results.

NX Automation Designer – Electrical Design

Provides model geometry and property re-use of NX designs and enables designers to structure devices in independent aspects, name and reference designation rules and validate engineering results.

NX Automation Designer – Cabinet Design

This add-on to NX Automation Designer - Electrical Design enables designers to create mounting layouts in 3D and perform collision analyses.

NX design products key add-ons overview
